

# DeepTrack - Example 4 - Tracking multiple particles

January 24, 2019

## 1 Example 4: Tracking of one of two kinds of multiple particles with DeepTrack 1.0

Example code to use DeepTrack to track one of two kinds of multiple particles. See also Figure 4c.

DeepTrack 1.0 Digital Video Microscopy enhanced with Deep Learning version 1.0 - 30 November 2018 I' Saga Helgadottir, Aykut Argun & Giovanni Volpe [Soft Matter Lab](#)

### 1.1 1. INITIALIZATION

```
In [1]: import deeptrack
```

### 1.2 2. PLAY VIDEO TO BE TRACKED

The video to be tracked is played.

Video file: DeepTrack - Example 4 - Brownian particles + bacteria.mp4

Note that the video file must be in the same folder as this notebook.

```
In [2]: %%HTML
```

```
<video width="400" height="400" controls>
<source src="DeepTrack - Example 4 - Brownian particles + bacteria.mp4" type="video/mp4">
</video>
```

<IPython.core.display.HTML object>

### 1.3 3. CHECK IMAGE GENERATION ROUTINE

Here, we simulate images of multiple particles similar to those we want to track. In this case, we simulate images with six particles, with four representing Brownian particles and two representing bacteria. One of the Brownian particles is positioned within 12.5 pixels from the center, and the others within 27.5 pixels from the center. An additional requirement is that the first Brownian particle is always closest the center. All the particles have a radius between 2 and 3 pixels. The Brownian particles are represented by a Bessel function of second order with a negative intensity (a dark ring) and the bacteria are represented by a Bessel function of first order with a positive intensity (a bright spot). The image background, SNR and illumination gradient are randomly selected from a range of values simulating the video conditions. This results in dark rings and bright

spots on a dark or bright background with low SNR and gradient intensity. This image generator was used to train the pretrained network saved in the file "DeepTrack - Example 4 - Pretrained network.h5".

Comments: 1. The `image_parameters_function` is a lambda function that determines the kind of particle images for which the deep learning network will be trained. Tuning its parameters is the simplest way to improve the tracking performance. 2. The `image_generator` is a lambda function that works as image generator. It does not need to be changed in most cases. 3. The parameter `number_of_images_to_show` determines the number of sample images that are shown. 4. The red symbol superimposed to the images represents the ground truth particle position.

```
In [3]: ### Define image properties  
        %matplotlib inline  
        from numpy.random import randint, uniform, normal, choice  
        from math import pi  
  
        particle_number = 6  
        first_particle_range = 12.5  
        other_particle_range = 27.5  
        particle_distance = 50  
  
        def get_image_parameters_optimized():  
            (particles_center_x, particles_center_y)=deeptack.particle_positions(particle_number)  
            image_parameters = {}  
            image_parameters['Particle Center X List'] = particles_center_x  
            image_parameters['Particle Center Y List'] = particles_center_y  
            image_parameters['Particle Radius List'] = uniform(2, 3, len(particles_center_x))  
            image_parameters['Particle Bessel Orders List'] = [[2, ], [1, ], [2, ], [2, ], [1,  
            image_parameters['Particle Intensities List'] = [[-uniform(0.12, 0.16, 1), ], [uni.  
            image_parameters['Image Half-Size'] = 25  
            image_parameters['Image Background Level'] = uniform(.1, .5)  
            image_parameters['Signal to Noise Ratio'] = uniform(10, 15)  
            image_parameters['Gradient Intensity'] = uniform(0, 0.05)  
            image_parameters['Gradient Direction'] = uniform(-pi, pi)  
  
            return image_parameters  
  
        image_parameters_function = lambda : get_image_parameters_optimized()  
  
        ### Define image generator  
        image_generator = lambda : deeptack.get_image_generator(image_parameters_function)  
  
        ### Show some examples of generated images  
        number_of_images_to_show = 100  
  
        for image_number, image, image_parameters in image_generator():  
            if image_number>=number_of_images_to_show:  
                break
```

## 1.4 4. USE A PRETRAINED DEEP LEARNING NETWORK

The pretrained network saved in the file "DeepTrack - Example 4 - Pretrained network.h5" is loaded and its performance on selected video is tested.

Video file: DeepTrack - Example 4 - Brownian particles + bacteria.mp4

Note that the file "DeepTrack - Example 4 - Pretrained network.h5" and the video file must be in the same folder as this notebook.

Comments: 1. number\_frames\_to\_be\_tracked can be changed to track different number of frames. If number\_frames is equal to 0 then the whole video is tracked. 2. box\_half\_size is half the size of the box to be scanned over the frames. The resulting sample should be comparable to the training image. 3. box\_scanning\_step is the step that is used to scan the box over the frame. It can be increased for higher accuracy or decreased for lower computational time.

```
In [5]: ### Define the video file to be tracked
        video_file_name = 'DeepTrack - Example 4 - Brownian particles + bacteria.mp4'

        ### Define the number of frames to be tracked
        number_frames_to_be_tracked = 2

        ### Define the size of the box to be scanned over the frames
        box_half_size = 25

        ### Define the scanning step over the frame
        box_scanning_step = 5

        ### Load the pretrained network
        saved_network_file_name = 'DeepTrack - Example 4 - Pretrained network.h5'
        network = deeptack.load(saved_network_file_name)

        ### Track the video
        (frames, predicted_positions_wrt_frame, predicted_positions_wrt_box, boxes_all) = deeptack.track(
            video_file_name,
            network,
```

```

        number_frames_to_be_tracked,
        box_half_size,
        box_scanning_step)

```

```

/anaconda3/lib/python3.6/site-packages/h5py/___init___py:36: FutureWarning: Conversion of the s
from ._conv import register_converters as _register_converters
Using TensorFlow backend.

```

## 1.5 5. SHOW EXAMPLES OF TRACKED SCANNING BOXES

The tracked scanning boxes are plotted over a range of frames, rows and columns.

Comments: 1. `frame_to_be_shown` can be changed to view different frames. 2. `rows_to_be_shown` can be changed to view different rows of each of the frames. 3. `columns_to_be_shown` can be changed to view different columns of each of the frames. 4. The blue symbol is the deep learning network prediction for the position (x, y).

```

In [6]: ### Define frames, rows and columns of the samples to be shown

```

```

    frames_to_be_shown = range(1)
    rows_to_be_shown = range(10,15)
    columns_to_be_shown = range(5,20)

```

```

### Show boxes

```

```

deeptrack.plot_tracked_scanning_boxes(
    frames_to_be_shown,
    rows_to_be_shown,
    columns_to_be_shown,
    boxes_all,

## 1.6 6. SHOW EXAMPLES OF TRACKED FRAMES

The tracked frames are shown.

Comments: 1. `particle_radial_distance_threshold` can be changed to choose which prediction points (blue dots) are to be used to calculate the centroid positions (orange circles). We used 3.75 pixels. 2. `particle_maximum_interdistance` can be changed to choose what predicted points (blue dots) belong to the same particle. We used 10 pixels.

```
In [7]: ### Define minimum radial distance from the center of the scanning boxes
        particle_radial_distance_threshold = 3.75
```

```
### Define the minumum distance between predicted scanning points for them belonging to
        particle_maximum_interdistance = 10
```

```
### Visualize tracked frames
```

```
deeptrack.show_tracked_frames(  
    particle_radial_distance_threshold,  
    particle_maximum_interdistance,  
    min(number_frames_to_be_tracked, 10),  
    frames,  
    predicted_positions_wrt_frame)
```
